

AMENDMENTS TO THE CLAIMS:

This listing of claims will replace all prior versions, and listings, of claims in the application:

LISTING OF CLAIMS:

- Sub 317
1. (Currently amended): A method comprising:  
determining a code phase of each among a plurality of received signals, wherein said received signals are GPS signals; and  
transmitting a time difference between the code phases ~~information pertaining to a time relation between the code phases~~ of at least one pair among the plurality of received signals.
  2. (Canceled)
  3. (Original): The method according to claim 1, wherein each among the plurality of received signals has a corresponding periodic code, and  
wherein each among the code phases relates to a predetermined position within the corresponding periodic code.
  4. (Original): The method according to claim 1, wherein each among the plurality of received signals is based at least in part on a corresponding direct-sequence spread spectrum modulated signal.
  - 5 (Original): The method according to claim 1, wherein each among the plurality of received signals is based at least in part on a corresponding direct-sequence pseudonoise modulated signal.
  - 6 (Original): The method according to claim 1, the method further comprising receiving a composite signal,  
wherein each among the plurality of received signals is based at least in part on at least a portion of the composite signal.
- 41  
Cont

7 (Original): The method according to claim 6,  
wherein the determining a code phase of each among a plurality of received signals comprises calculating a correlation, for each among the plurality of received signals, between a corresponding code sequence and a signal based at least in part on the composite signal,  
wherein each among the plurality of received signals has a corresponding periodic code, and  
wherein each among the code phases relates to a corresponding predetermined position within the corresponding periodic code, and  
wherein the code sequence relates at least in part to the corresponding periodic code.

8 (Currently amended): A method comprising:  
determining a code phase of a first received signal; and  
determining a code phase of a second received signal,  
wherein said first and second received signals are GPS signals, and  
wherein the determining a code phase ~~of a~~ of the second received signal is based at least in part on a time difference ~~information pertaining to a time relation~~ between the code phase of the first received signal and the code phase of the second received signal.

9 (Canceled)

10 (Original): The method according to claim 8, wherein the first received signal has a corresponding periodic code and the second received signal has a corresponding periodic code, and  
wherein each among the code phase of the first received signal and the code phase of the second received signal relates to a corresponding predetermined position within the corresponding periodic code.

11 (Original): The method according to claim 8, wherein each among the first received signal and the second received signal is based at least in part on a corresponding direct-sequence spread spectrum modulated signal.

12 (Original): The method according to claim 8, wherein each among the first received signal and the second received signal is based at least in part on a corresponding direct-sequence pseudonoise modulated signal.

13 (Original): The method according to claim 8, the method further comprising receiving a composite signal, wherein each among the first received signal and the second received signal is based at least in part on at least a portion of the composite signal.

14 (Original): The method according to claim 13,

wherein the determining a code phase of a first received signal comprises calculating a correlation between a code sequence and a signal based at least in part on the composite signal,

wherein the first received signal has a corresponding periodic code and the second received signal has a corresponding periodic code, and

wherein each among the code phase of the first received signal and the code phase of the second received signal relates to a corresponding predetermined position within the corresponding periodic code, and

wherein the code sequence relates at least in part to the periodic code corresponding to the first received signal.

15 (Currently amended): An apparatus comprising:

a GPS receiver configured to receive a plurality of signals;

a correlator configured to determine a code phase for each among the plurality of received signals; and

a transmitter configured to transmit a time difference between the code phases ~~information pertaining to a time relation between the code phases~~ of at least one pair among the plurality of received signals.

16 (Canceled)

17 (Original): The apparatus according to claim 15, wherein each among the plurality of received signals has a corresponding periodic code, and

wherein each among the code phases relates to a predetermined position within the corresponding periodic code.

18 (Original): The apparatus according to claim 15, wherein each among the plurality of received signals is based at least in part on a corresponding direct-sequence spread spectrum modulated signal.

19 (Original): The apparatus according to claim 15, wherein each among the plurality of received signals is based at least in part on a corresponding direct-sequence pseudonoise modulated signal.

20 (Original): The apparatus according to claim 15,

wherein the correlator is further configured to determine a code phase for each among the plurality of received signals at least in part by calculating a correlation, for each among the plurality of received signals, between a corresponding code sequence and the plurality of received signals,

wherein each among the plurality of received signals has a corresponding periodic code;

wherein each among the code phases relates to a corresponding predetermined position within the corresponding periodic code, and

wherein the corresponding code sequence relates at least in part to the corresponding periodic code.

21 (Currently amended): An apparatus comprising:

a GPS receiver configured to receive a first and second signal and to receive a signal comprising ~~information pertaining to a time relation~~ a time difference between the code phase of the first received signal and the code phase of the second received signal, and

a correlator configured to determine a code phase of at least one of the first and second received signals with respect to a predetermined code and to correlate the other of the first and second received signals to the predetermined code based upon the time relationship between the first and second received signals.

22 (Canceled)

23 (Original): The apparatus according to claim 21, wherein the correlator is further configured to determine a code phase for the second received signal at least in part from the information.

24 (Currently amended): A system comprising:

a reference receiver configured to receive GPS signals from a plurality of space vehicles and to transmit information; and

a field receiver configured to receive signals from a plurality of space vehicles and to receive the information,

wherein the reference receiver determines a reference code phase for each among at least a first one and a second one of the signals, and

wherein the information pertains at least to ~~a time relation~~ a time difference between the reference code phases for the first one and the second one of the signals, and

wherein the field receiver determines a field code phase for the first one of the signals, and

wherein the field receiver determines a field code phase for the second one of the signals at least in part from the information.

25. (Canceled)
